

Dissertation Proposal

LLM-Enhanced Dynamic Graph Networks for Conversion Rate Prediction

Liu Yize | UCL MSc KIDS | June 2026

RESEARCH OVERVIEW

LLM + Dynamic Graph + CVR
Delayed Feedback Correction

Problem

CVR Prediction

Delayed Feedback

ID-only Features

Related Work

DFM/ES-DFM/FSIW/DEFER

LightGCN/TGN/DGSR

LLM RecSys

Method

① LLM Encoder

② Dynamic Graph

③ DF Correction

Experiments

Dataset: Ali-CCP

Baselines: DGSR/DEFER

Metrics: AUC

RESEARCH QUESTIONS

RQ1

LLM embeddings vs. ID embeddings
in CVR prediction performance

RQ2

Do LLM semantics reduce
delayed feedback false negatives?

RQ3

Computational cost vs.
accuracy gain trade-off?

PROPOSED ARCHITECTURE

Text Features
(item/user desc.)

LLM Encoder
(BERT / LLaMA)

Dynamic Graph
(DGSR-based)

DF Correction
(DEFER/FSIW loss)

CVR Prediction

Key Talking Points

Supervisor Meeting — June 2026

1. Literature Review — What I've Read

- Delayed Feedback (4 papers): DFM, ES-DFM, FSIW, DEFER
→ Core insight: training labels are unreliable due to conversion delay; approaches range from EM-based delay modelling (DFM) to distributional correction (FSIW/DEFER)
- Graph Neural Networks (3 papers): LightGCN, TGN, DGSR
→ DGSR is my base architecture: dynamic graph with cross-user collaborative signals, long-term + short-term preference modelling
- LLM for RecSys (in progress): BERT4Rec, UniSRec, RLMRec, TALLRec — reading this week

2. Research Gap & Motivation

- Existing CVR models (including DGSR) rely on ID-based embeddings — no semantic understanding
- Delayed feedback correction methods do not leverage semantic item/user representations
- No prior work integrates LLM embeddings into dynamic graph networks for CVR with delayed feedback
→ My dissertation bridges all three: LLM + Dynamic Graph + Delayed Feedback Correction

3. Proposed Methodology

- Layer 1 — LLM Encoder: encode item/user text descriptions → semantic embeddings
(Replace ID embeddings in DGSR with LLM-derived representations)
- Layer 2 — Dynamic Graph: DGSR-style neighbour aggregation on the semantic graph
(Long-term preference via order-aware attention + short-term via last-item attention)
- Layer 3 — Delayed Feedback Correction: modified training objective
(Drawing from DEFER/FSIW to correct false-negative labels during training)

4. Planned Experiments

- Dataset: Evaluating Ali-CCP (Alibaba, click+conversion) vs. Criteo Conversion — to confirm next week
- Baselines: DGSR (graph w/o LLM), DEFER (delayed feedback w/o graph), LightGCN, DFM
- Metrics: AUC, NLL (model fit), Inference Latency (computational trade-off)
- Ablation: LLM only | Graph only | DF-correction only | Full model

5. Timeline

- | | |
|-----------|--|
| This week | Complete LLM RecSys paper review (4 papers) |
| Next week | Finalise dataset selection & begin preprocessing |
| Week 3–4 | Draft Methodology chapter + implement baselines |
| Month 2 | Run initial experiments, collect results |
| Month 3 | Full analysis, write-up, dissertation submission |
